American Society of Clinical Oncology Position Statement

Drug Repository Programs

Approved by the ASCO Board of Directors January 16, 2020

INTRODUCTION

The cost of pharmaceutical drugs and resulting strain on patients’ ability to afford them has become a pervasive issue in the health care system. The cost of drugs represents a large and increasing portion of the financial burden of cancer care. While pharmaceutical drug repository programs, also known as “drug donation and reuse” programs are not new, there is new focus on their potential as a practical way to increase access to prescription drugs for patients.

ASCO members have expressed interest in drug repository programs as a means to alleviate some of the challenges associated with drug affordability, access, and waste. In 2017, ASCO published a Position Statement on the Affordability of Cancer Drugs, affirming its commitment to supporting and promoting practical policy solutions that ensure patients with cancer have access to—and can afford—drugs vital to the treatment of their disease. ASCO also identified waste as a concern in a 2018 Position Statement on Pharmacy Benefit Managers and their Role in Cancer Care. In that statement, ASCO asserted that “each wasted vial of cancer medication represents an important expense for a cancer patient and a lost opportunity for appropriate treatment.”

ASCO is committed to helping patients access the right treatment at the right time. As such, we support drug repository programs solely for oral medications provided they are maintained within a closed system. A closed system is defined as one in which the delivery to and/or return of prescription medicines from a health care or other institutional facility is maintained in a controlled environment under the supervision of a health care practitioner and not the patient. Drug repository programs within a closed distribution system are compliant with FDA policy on the return of unused prescriptions and ensure that the received surplus medicines are administered in a safe, effective, and private manner which can then be dispensed in accordance with the prescribing clinician’s guidance. Any state or federal legislation regarding drug repositories must address the concerns that result when a surplus drug leaves an institutional facility to then be re-entered into the drug supply chain (i.e. not in a closed system). Additionally, ASCO makes the following recommendations:

- States with no such laws should implement drug repository programs that include liability protections for participants and in accordance with their state health regulatory authority.
- Patients should receive appropriate notification that they are receiving a donated prescription drug.
- ASCO and other professional medical associations should make efforts to educate physicians regarding the existence and value of such programs.
- Drug repository programs should be implemented at no additional cost to the patient beyond a handling fee based on Medicaid’s standard pharmacy dispensing fee.
DRUG AFFORDABILITY AND WASTE

The High Costs of Drugs

Cancer drugs represent an increasing portion of health care costs, with United States’ spending substantially increasing over the last 5 years, from $33 billion in 2014 to $58 billion in 2018; and expected to continue trending upwards. Cancer drugs often are specialty drugs, which include biological products frequently administered as injections or infusions, sometimes requiring special handling and administration. They tend to be substantially more expensive than traditional drugs. In just one pharmacy benefit managers’ nationwide commercial plans, specialty drugs accounted for 45% of drug spending in 2018, with oncology drug pricing increasing at a rate of more than 20% per year. Overall, prescription drugs sold in retail pharmacies accounted for almost $344 billion in 2018, up 36% from 2009 – a rising trend that has been consistent over the past 50 years.

Patient Affordability and Access

Costs for prescription drugs have risen to the point where many patients cannot afford them, leading to treatment non-compliance, drug abandonment, and resultant negative health outcomes. A small share of the most expensive drugs (8.8 percent) had an out-of-pocket cost of more than $500, with 2.2% of patients paying over $1,500; total out-of-pocket expenditures for these drugs was $61 billion. Research has shown that prescriptions with such high cost sharing for patients often are not filled because of inability for patients to absorb such high out-of-pocket costs. Drug abandonment such as this can have a serious effect on patient health, leading to hospitalizations, extensive health care costs, and even death. The abandonment rate for brand-name drugs accounts for 40 percent of all abandoned claims for new patients, in contrast to new patient abandonment rates for generics which are three times lower. One recent study found that distributing essential medicines at no charge led to increased adherence to treatment and some improvement in health outcomes.

Drug Waste

In its 2012 report, the National Academies of Science estimated the health care system wastes approximately $750 billion a year—a quarter of total health care spending. For their part, providers seek to restrain costs and growth in expenditures in their practice through quality improvement and efficient scheduling practices that help reduce waste. Factors such as pricing, vial size availability, and drug shortages are fueling the demand to reduce costs associated with drug waste.

There are concerning reports about the amount of drug waste from health care facilities discarding useable drugs. In Colorado, the state’s 220 long-term care facilities reportedly throw away 17.5 tons of potentially reusable drugs every year, worth an estimated $10 million. In 2015, the Environmental Protection Agency estimated that about 740 tons of drugs are wasted by nursing homes every year. State governments, providers, and patients have a common interest in reducing the amount of waste within their healthcare systems.

Unfortunately, many pharmaceuticals used in the treatment of cancer related care are not eligible for drug repository programs. According to a 2016 study in the British Medical Journal, an estimated $3 billion in leftover cancer drugs are discarded in the United States every year.
expensive leftover injection and infusion drugs that the study describes are generally ineligible for state-level donation programs because they: (i) do not meet the program’s unopened packaging requirements; and (ii) have very short timeframes in which the leftover drug would be safe for use. ASCO’s position is that drug repository programs are appropriate in cancer care, but only for oral medications and provided the drugs are within a closed distribution system. Widespread use of these programs may incentivize all stakeholders to effect change that could result in decreased costs to patients and unused medications in the outpatient setting.

BACKGROUND ON DRUG REPOSITORY PROGRAMS

Pharmaceutical repository programs facilitate donation of unused prescription drugs to patients. The first known state law permitting use of donated prescription drugs was enacted in Georgia in 1997. Since then, according to a 2018 survey conducted by the National Conference of State Legislatures, a total of 38 states and Guam have passed legislation establishing prescription drug repository programs. Sixteen of these state programs (including Guam and Washington, D.C.) are not currently operational, meaning that although a state has enacted laws allowing for drug repositories, there is no active level of donation and re-dispensing transactions. Currently, 14 states have no law or program.

These programs are designed to collect unused prescription drugs and redistribute them to eligible patients within the state. Of the states with statutory programs in place, there are 13 that have established drug repository programs specific to unused cancer drugs, supplies, and devices. These cancer-specific programs are intended to reduce prescription drug waste, reduce drug cost to public and private health payers, and increase access to cancer drugs for low-income state residents.

Most drug repository programs exclude controlled substances, expired drugs, and drugs that show any signs of tampering, misbranding, deterioration, compromised integrity, or adulteration. They typically require that all drugs be inspected by a pharmacist, a pharmacy contracted delivery service, or an approved common carrier (i.e. a company that transports the drugs) prior to being dispensed. They commonly include liability protections for both donors and recipients. State programs contain varying provisions governing types of drugs accepted for redistribution and re-dispensing ([all vs. only prescription vs. only over the counter (OTC) or only cancer-specific (oral vs. parenteral)], and eligibility criteria for patients receiving donated drugs. Other differences in legislation include the minimum number of months before expiration date, protocol for transfer and repackaging, maximum dispensing fees, whether there is program funding, and whether the operation is centralized vs. decentralized.

Most state programs allow only state or federally regulated health professionals to donate, accept, inspect, or dispense donated drugs under their state program in order to ensure integrity of donated drugs and patient safety. However, some states allow any individual to donate directly to the programs. Commonly, states require that donated drugs be delivered to a medical or pharmacy facility. Existing state programs are regulated by their respective Boards of Pharmacy or Departments of Health. For a comprehensive list of differences in existing state legislation please see Tables 1 and 2.

The National Association of Boards of Pharmacy (NABP) “endorses the return and reuse of medications that have been maintained in a closed system.” The NABP defines a closed system as the “delivery to and/or return of prescription medication from a healthcare or other institutional
facility, which is maintained in a controlled environment under a health care practitioner and not the patient.” Although the NABP does not endorse the reuse of medications that have left a closed distribution system, there are drug repository programs in place that distribute donated drugs that have previously left a closed distribution system.\textsuperscript{25} The American Medical Association (AMA) posits that drug repository programs which include drugs outside of a closed distribution system should be registered and under the jurisdiction of their respective Boards of Pharmacy and be subject to strict criteria, inspection, and be kept in a separate inventory.\textsuperscript{26} While ASCO supports the protections recommended by the AMA in this respect, we support only drug repository programs for oral medications maintained within a closed system.

While each state’s prescription drug repository program is unique, these programs tend to incorporate the following common provisions:\textsuperscript{27}

### Labeling and Packaging
- Must be unopened and in their original, sealed, tamper-evident packaging.
- No adulterated or misbranded medications accepted.
- Medications packaged in a single-unit dose packing may be accepted provided the single-unit dose packaging is unopened.

### Donation and Recordkeeping
- Donation eligibility should be limited to the outpatient setting and within a closed distribution system.
- Must be inspected for compliance with labeling and packaging requirements by a state-licensed pharmacist.
- Donated drugs must be accompanied with a donor form attesting that the drug has not been tampered with.
- Forms must be maintained by the entity accepting the donated drugs in accordance with state recordkeeping requirements.
- Dispensing entities may not re-package or re-sell donated drugs but may charge a "handling fee" that is determined by its state health regulatory authority.
- State prescription drug repository programs should set limits on which drugs should be excluded from eligibility.
- State programs should not accept expired medications.
- State programs should exclude all controlled substances from their prescription drug repository programs.

### Dispensing
- Entities dispensing donated drugs must store and handle drugs in accordance with state and federal regulations.
- Donated drugs must meet strict safety standards as regulated by the Boards of Pharmacy or Departments of Health.
- States should have explicit liability disclaimers protecting compliant participant entities from civil or criminal liability in the event of an adverse reaction, injury, death, or loss to person or property relating to participating in the cancer drug repository program.
FINANCIAL IMPACT ON STATES

The fiscal impact to operate a drug repository program varies by the operating characteristics of the program, outreach and expected utilization rates. However, based on ongoing successes illustrated by currently operational state programs and the amount of drug waste otherwise generated, there is ample opportunity for cost savings for states that develop drug repository programs. According to an informal collaborative information exchange with the National Council of State Legislators (NCSL) and SIRUM, a non-profit organization that provides logistical support for drug repository programs, cost savings and patient access are substantial for states that have implemented drug repository programs. In Iowa, the state-supported drug repository program reported that between 2007 and 2012, $5.9M worth of drugs were donated to 26,800 eligible residents. Since its program began, Iowa has generated more than $17.7M in cost savings with over 71,000 patients through 2016. Since 2007, Wyoming’s program has filled over 150,000 prescriptions worth over $12.5M, with $2.4M worth of prescription medications donated in 2016 alone. In Oklahoma, 248,305 prescriptions were filled with an estimated savings of $25.01M through October, 2019.

ASCO’S POSITION ON DRUG REPOSITORY PROGRAMS

In 2017, ASCO published a Position Statement on Addressing the Affordability of Cancer Care Drugs. In that statement, ASCO affirmed the following:

• “ASCO is committed to supporting and promoting practical policy solutions that ensure patients with cancer have access to—and can afford—drugs vital to the treatment of their disease.”
• “ASCO is firm in its position that any policy solutions to address the price of cancer drugs must promote access to care for patients, affordability of drugs vital to their treatment, and innovation in drug development. Regardless of the specific policy recommendations pursued, defining value must underpin the drug pricing debate.”

ASCO is committed to helping patients access the right treatment at the right time. **As such, we support drug repository programs solely for oral medications provided they are maintained within a closed system.** A closed system is defined as one in which the delivery to and/or return of prescription medicines from a health care or other institutional facility is maintained in a controlled environment under the supervision of a health care practitioner and not the patient. Drug repository programs within a closed distribution system are compliant with FDA policy on the return of unused prescriptions and ensure that the received surplus medicines are administered in a safe, effective, and private manner which can then be dispensed in accordance with the prescribing clinician’s guidance. Any state or federal legislation regarding drug repositories must address the concerns that result when a surplus drug leaves an institutional facility to then be re-entered into the drug supply chain (i.e. not in a closed system). Additionally, ASCO makes the following recommendations:

• **States with no such laws should implement drug repository programs that include liability protections for participants and in accordance with their state health regulatory authority.**
• Patients should receive appropriate notification that they are receiving a donated prescription drug.
• ASCO and other professional medical associations should make efforts to educate physicians regarding the existence and value of such programs.
• Drug repository programs should be implemented at no additional cost to the patient beyond a handling fee based on Medicaid's standard pharmacy dispensing fee.

Table 1: State-by-State Analysis of Drug Repository Programs
(Adapted from State-by-State Query of Drug Repository Programs and the National Conference of State Legislatures.)

The information is accurate as of 1/23/2020. Interested parties should review their respective state Department of Health or Board of Pharmacy for updates.

“Operational” refers to a state that has enacted drug repository legislation and has had some level of drug repository transactions. Having an operational drug repository program does not mean that a repository may be open or available in a given geographic area, nor that a potential recipient will be able to receive a prescription drug, or that a requested drug is authorized or available for reuse. For States that have no active program, please see Table 2.

Operational State Programs highlighted in blue indicate states which accept and distribute cancer-related prescription drugs.

### Wisconsin Administrative Code; Department of Health Services (DHS); Chapter 148

- **Drug Donation Program – Repository**
- Giving priority to the uninsured and those eligible to receive Medicaid or Medicare.
- Have not been previously dispensed or administered.
- In the program and meets requirements specified by rule by the department. State prison pharmacies.

### Wyoming

- **Wyoming Medication Drug Donation Program**
- Wyoming residents; those without prescription insurance, low income or on Wyoming Medicaid.
- Any person or entity, including but not limited to a drug manufacturer, physician or health care facility.
- Individuals may donate at a donation site maintained by the Department of Public Health, approved take-back events, at any physician’s office, or a pharmacy or health care facility that elects to participate in the program and meets criteria established by the Department.

### Table 2 – States (including Guam and Washington, DC) with No Active Drug Repository Program

States may have enacted law allowing for a drug repository program but no infrastructure to create a drug repository.

This information is accurate as of 12/1/2019. Interested parties should review their respective state Department of Health or Board of Pharmacy for updates. States highlighted in blue indicate legislation that includes cancer-related drug repository.
